

Upgrade to version 1.7

microelephant.io/prowriters/upgrade-to-version-1.7

How to upgrade to Prowriters version 1.7

You can upgrade to version 1.7, only from version 1.6

- Unzip the latest copy of **prowriters.zip** file to your local computer
- Delete a file called **.env**. It is a hidden file. If you cannot see it you have to enable viewing hidden files on your computer.
- Next delete a folder called “**Storage**”
- Next, navigate to the folder called “**public**” and upload all it’s files and folders, except the **index.php** file, to your remote server inside the **public** folder or your domain’s document root. Then delete the **public** folder from your local computer
- Now upload rest of the files to your server where you have rest of the files and folder from the previous version of Prowriters
- Now go to your browser and log in to the application and go to Manage > Settings. Don’t navigate to other links just yet, otherwise, you might encounter an error.
- Find a newly added menu item called “**System Update**”, click on it and then click on the green button that says “Upgrade to v1.x”
- That’s it. Your system is now updated to the latest version

Change Log

- fixed - website menu breaks in large devices
